

# R-300A RECEIVER

## PREMIUM AMATEUR RADIO VERSION

- ◆ COVERS THE ENTIRE 222.000 - 224.990MHz BAND IN 10kHz STEPS FOR QUICK AND ACCURATE FREQUENCY SELECTION

- ◆ SUPER SELECTIVE 8 POLE SSB CRYSTAL FILTER FOR GREATER RANGE IN HIGHLY CONGESTED RF ENVIRONMENTS

- ◆ .5 PPM TCXO FOR SUPERIOR FREQUENCY STABILITY UNDER ALL TEMPERATURE CONDITIONS

- ◆ NEW 4 POSITION RF GAIN SWITCH FOR PINPOINT CLOSE-IN POSITION ACCURACY

## Operating Manual

**Introduction by Gordon West**  
**SIMPLE HAM RADIO**  
**LICENSING**

**WB6NOA**

It is easy to obtain your Amateur Radio entry level Technician Class license.

The licensed amateur radio operator, nicknamed a “ham”, has unrestricted full privileges on all VHF and UHF bands. These unrestricted privileges include the popular 6 meter band for Radio Control (R/C) operation, plus the 222 MHz band for HIGH POWER R/C, rocket, pet, and hidden "T" transmitters.

Simple ham radio licensing puts you at 1 FULL WATT on R/C 6 meter channels with nearly unrestricted power levels on 222 MHz R/C channels.

The Communications Specialists, Inc. 222 MHz transmitters are designed for licensed ham radio operation on vacant interstitial “channels” throughout the 222 MHz – 225 MHz ham band. The 25 millisecond pulse won’t usually be detected by ham operators using conventional FM (Frequency Modulated) mobile or handheld transceivers. Your sensitive Communications Specialists receiver employs SSB (Single Sideband) filtering so narrow that the receiver won’t pick up voice ham radio transmissions either!

Recent FCC rulemaking has simplified the entry level ham radio test. MORSE CODE HAS BEEN ELIMINATED FOR ALL LEVELS OF HAM RADIO EXAMINATION. The multiple choice exam has been rewritten to a grade school level. All examination questions, plus the correct multiple choice answers, are published in my Technician Class book, word for word! The test is only 35 Q&A’s with 74% pass requirement. Study time with my book is approximately 20 days, and you take the exam from 3 accredited, local volunteer ham examiners. The FCC issues your license about 7 days later.

To order my book and/or my software and CD audio courses, simply call, toll free, 1-800-669-9594. If you want to learn more about ham radio or my ham classes, see [www.gordonwestradioschool.com](http://www.gordonwestradioschool.com), or call me with your questions at 1-714-549-5000. Tell them Gordon West and Communications Specialists, want you on the air as a licensed Technician Class ham radio operator. Complete the course, earn your license, and go LONG RANGE with Communications Specialists products.

## MODEL R-300A RECEIVER SPECIFICATIONS

- Frequency coverage: 222.000 to 224.990MHz in 10kHz steps (covers all 128 transmitter channels)
- Fine tuning: + or - 500Hz from channel center
- Extremely good MDS sensitivity: -150dBm
- Selectivity: 70dB down @ 4kHz, 80dB down @ 10kHz
- IF filtering: 10.7MHz 8 pole SSB crystal filter, 455kHz 8 pole ceramic filter
- Front end: Dual MOSFET with 6 helical resonators, high side injection eliminates interference from CH 11 television transmitters
- Mode of operation: SSB/CW
- Frequency stability: PLL controlled by .5 PPM TCXO
- Attenuator: -20, -40, -70dB switchable
- Antenna jack: standard BNC female
- Headphone jack: standard 3.5mm mono
- Loud, great sounding audio for in vehicle use
- Powered by standard, easy to change, 9v alkaline battery
- External power jack: standard circ., 5.5mm x 2.1mm, center positive
- Housed in a rugged aluminum case
- Supplied with FA-3 high gain (+5dB) Moxon, highly directional folding antenna for easy to use one handed operation
- Size: 6.2"x3.5"x1.4", less projections
- Overall size with antenna folded: 12"x4.75"
- Overall size with antenna extended: 20.25"x11.25"
- Weight: 18oz without antenna, 31oz with antenna
- Full 1 year warranty
- Fast same day shipping
- Easy website ordering
- Can be shared for club use

## HOW THE SYSTEM WORKS

A miniature transmitter is installed in an R/C plane, rocket, pet collar, or any other item. It also may be hidden for "T" hunting. It transmits either a low or high power, pulsed, radio frequency signal in the 222-225 MHz Amateur Band. This signal is picked up by a folding directional antenna (that rivals a yagi in performance) attached to a very sensitive handheld receiver. As the antenna is pointed towards the transmitter, the signal becomes louder in the receiver. This allows you to "home-in" or DF (direction find) the transmitted signal and locate it. This is the same system biologists use to track wild animals and can be used anywhere in the world. A system is comprised of a R-300A receiver, which can be shared for club use, and up to 128 transmitters operating simultaneously without interference. Locate the transmitter day or night in the least possible time and avoid unnecessary intrusions into backyards or private property. The range is over 5 miles on the ground and over 50 miles in the air with Communications Specialists' High Power transmitters and up to 1 mile with Communications Specialists' Low Power transmitters. The transmitters are sold separately. The R-300A is a TCXO controlled, synthesized PLL design, that will not drift in frequency under any temperature extremes.

A partial list of compatible Communications Specialists transmitters is shown below. All are TCXO controlled, synthesized PLL designs. They all operate on any one of 128 channels in the 222-225 MHz Amateur Band.

RC-SP Low power (1mW) for R/C planes and "T" hunting  
RC-MP Medium power (5 mW) for rockets, R/C planes, and "T" hunting  
RC-HP High power (30 mW) for rockets, R/C planes, and "T" hunting  
CT Low power pet collar for cats  
DT Low power pet collar for small dogs  
PT-1 Low power hanging transmitter for kids or walk-aways

## R-300A RECEIVER CONTROLS

## 1. ANTENNA JACK

The antenna jack accommodates the coaxial cable with BNC plug from the supplied FA-3 folding directional antenna. To install the BNC plug, grasp it in one hand and the receiver in the other, push the BNC plug into the receiver antenna jack while turning the knurled nut clockwise until it locks into place. Twist the knurled nut counterclockwise until it stops and gently pull the BNC plug straight out to remove it.

## 2. METER

The meter on the R-300A has two uses. The first is to measure the relative strength of the incoming signal from your transmitter. Use the VOLUME CONTROL to set the meter around mid scale. Use the changes in upward meter movement in addition to listening to the transmitter's pulsed signal to determine when the signal is the strongest. The meter is also used to measure battery condition when the ON-OFF-BATTERY TEST SWITCH is in the BATTERY position. The battery indication box on the bottom part of the meter scale will indicate the battery voltage remaining. A six (6) on the meter is six (6) volts remaining (almost totally discharged battery). A nine (9) on the meter indicates nine (9) volts remaining (a good battery). Replace the battery when the needle falls into the bottom of the battery indication box.

## 3. RF GAIN SWITCH

The RF GAIN SWITCH is a 4 position rotary switch that is used to attenuate the signal going from the antenna to the R-300A. This is so the R-300A is not overloaded by a strong signal. In HIGH there is no attenuation, therefore the R-300A is listening with full sensitivity. In the second CCW (counter clockwise) switch position approximately 20dB of attenuation is inserted between the antenna and the R-300A. In the third CCW switch position another 20dB is inserted for a total of 40dB. In the LOW or full CCW switch position another 30dB is inserted for a total of 70dB. To DF your transmitter, always start in the HIGH position to make sure it can be heard and you are

satisfied with the pitch of the received tone (as set by the TUNE CONTROL). If you are able to hear your transmitter, change switch positions to the second CCW position and see if it can still be heard. If it can not, go back to HIGH, reduce the volume so the meter indicates around half scale and turn around in order to find the strongest signal strength. This will show what direction your transmitter is. Walk or drive in that direction until you can move the RF GAIN SWITCH to the second CCW position and still hear the signal. Continue to walk or drive in the direction of the strongest signal strength until you can change the RF GAIN SWITCH to the third CCW position. Finally, when you can change it to the LOW or full CCW position, you should be in sight of it.

#### 4. SPEAKER

A large, full audio range speaker is used to provide very good sound quality. Keep liquids, dirt, sand, and other foreign material from falling into the small holes in the speaker grill.

#### 5. ON-OFF-BATTERY TEST SWITCH

In the OFF position, no battery current is drawn. This is how the switch should be left when the R-300A is not in use. When switched to the ON position, the R-300A is active and drawing current from the battery. In the BATTERY position, the condition of the battery under load is tested and the results are available on the METER.

#### 6. VOLUME CONTROL

The VOLUME CONTROL is used to raise or lower the audio level to the speaker and meter circuit. Adjust it to suit your own preference. Note that it is easier to DF a signal that falls around mid scale on the METER than one banging against the upper meter stop.

## 7. TUNE CONTROL

The TUNE CONTROL is used to fine tune the receiver over a 1 kHz total range (500 Hz to 1500 Hz high of the exact frequency selected by the channel selector). This allows you to adjust the frequency of the received audio tone within limits. The narrow tuning limit also guarantees the transmitter will be heard, no matter where the TUNE CONTROL is set.

## 8. CHANNEL SWITCHES

The CHANNEL SWITCHES are three push wheel switches. Just enter the 3 digit channel number of the transmitter you wish to hear. To advance to a higher channel, simply push the + button located under the switch window. To go to a lower channel, push the - button located over the switch window. The R-300A covers 222.000 to 224.990MHz in 10kHz steps. If you would like to enter frequency, instead of channel numbers, the first digit corresponds to MHz, the second digit corresponds to 100 kHz, and the last digit corresponds to 10 kHz. Some examples follow:

222.090 MHz displays as 209 (channel 209)  
222.550 MHz displays as 255 (channel 255)  
222.980 MHz displays as 298 (not a valid channel, but quite hearable)

223.170 MHz displays as 317 (channel 317)  
223.370 MHz displays as 337 (channel 337)  
223.900 MHz displays as 390 (not a valid channel, but quite hearable)

224.190 MHz displays as 419 (channel 419)  
224.410 MHz displays as 441 (channel 441)  
224.860 MHz displays as 486 (not a valid channel, but quite hearable)

**PLEASE NOTE: IF THE FIRST DIGIT IS ANY NUMBER OTHER THAN 2, 3, or 4, THE RECEIVER WILL BE MUTED AND NO AUDIO WILL BE HEARD FROM THE SPEAKER.**

## 9. BATTERY COMPARTMENT

The BATTERY COMPARTMENT on the bottom of the R-300A houses the 9 volt alkaline battery in a pull-out drawer. To open the drawer, place one of your fingernails in the slot on the bottom edge of the drawer and lift up with your finger until the drawer snaps upward. Then pull the drawer out. **DO NOT REMOVE THE TWO SCREWS HOLDING IN THE BATTERY COMPARTMENT!** With the drawer in your hand, pop up the battery and replace it, if discharged, with a new alkaline battery. Be sure to note the proper battery polarity when placing the battery back in the drawer. If you force the battery in with reversed polarity, the R-300A will not work but will not be damaged. Simply remove the battery drawer and flip the battery over.

Battery life at moderate volume levels is approximately four (4) hours. To conserve battery life, turn the R-300A off when not in use. Keeping a spare battery in your pocket, carrying case pocket, or vehicle is a good idea.

## 10. HEADPHONE JACK

A standard 3.5 mm (1/8") mono headphone plug can be inserted into this jack for use in noisy environments. If a stereo headphone is plugged in, audio will normally only be heard in one ear. When a plug is inserted into the jack, the internal speaker in the R-300A is disconnected.

## 11. DC POWER JACK

The DC power jack is used to power the R-300A with or without a battery in the BATTERY COMPARTMENT. Use the CM-1, 12vdc power cable, to connect to the cigarette lighter socket in the vehicle. If either an alkaline, NiMH, or Li-Polymer battery is installed, the battery is automatically bypassed and no current is drawn from it when this jack is used.

## CHANNEL TO FREQUENCY LIST ( MHz )

CH#	222MHz	CH#	223MHz	CH#	224MHz
207	222.070	301	223.010	401	224.010

### SPECIAL TRANSMITTER FREQUENCIES AVAILABLE

Any frequency from 222.000 to 224.999 MHz in 1 kHz steps is available for any type of Amateur Radio use. Same day shipping, no increase in cost is standard.

## USING THE R-300A TO FIND YOUR TRANSMITTER

As soon as you install a battery in your transmitter, make sure it is operating properly by listening to it with your R-300A set to the proper channel. This will insure that the battery was properly installed and that it is functioning. Follow the directions below to locate your transmitter.

1. Momentarily put the ON-OFF-BATTERY TEST SWITCH on the R-300A in the BATTERY TEST position to make sure the battery tests O.K. on the meter.
2. Extend the elements of the FA-3 directional antenna. Turn the ON-OFF-BATTERY TEST SWITCH to ON and set the VOLUME CONTROL to a comfortable listening level.
3. Push the CHANNEL SWITCHES to the frequency of your transmitter. You should be able to hear the pulses from it with the RF GAIN SWITCH in the HIGH position. If you can not, hold the R-300A level in your hand, use vertical antenna polarity to start with, turn around in a full circle and see if you hear it. If you can not, try horizontal antenna polarity and try again.

4. If you still do not hear the transmitter, you will have to change location to get closer to it. Try getting the antenna higher by standing on a truck bed, second story balcony, or nearby hill. Use a vehicle to get closer. Have the passenger, not the driver, hold the R-300A while pointing the antenna out the window until the transmitter is heard. Range will be shorter with the antenna inside the vehicle, so stop now and then, get outside, and turn around in a full circle to increase it. If you are in hilly terrain, drive as high as possible, get outside the vehicle, and turn around in a full circle until the transmitter is heard. Some vehicles generate considerable interference even with the key off. Get outside the vehicle if this is a problem.
5. When you hear the transmitter, note its direction, and head towards it. As the pulsing signal gets stronger, change the RF GAIN SWITCH to one of the two middle positions. Raise or lower the VOLUME CONTROL to keep the meter indication around mid scale
6. Recheck for proper direction and continue. When you get close to the transmitter, you can change the RF GAIN SWITCH to the LOW position (Full CCW) and generally walk towards the strongest signal until you find it.
7. It is a VERY good idea to try a few dry runs having someone else hide the transmitter with you finding it using the above method.

## ANTENNA

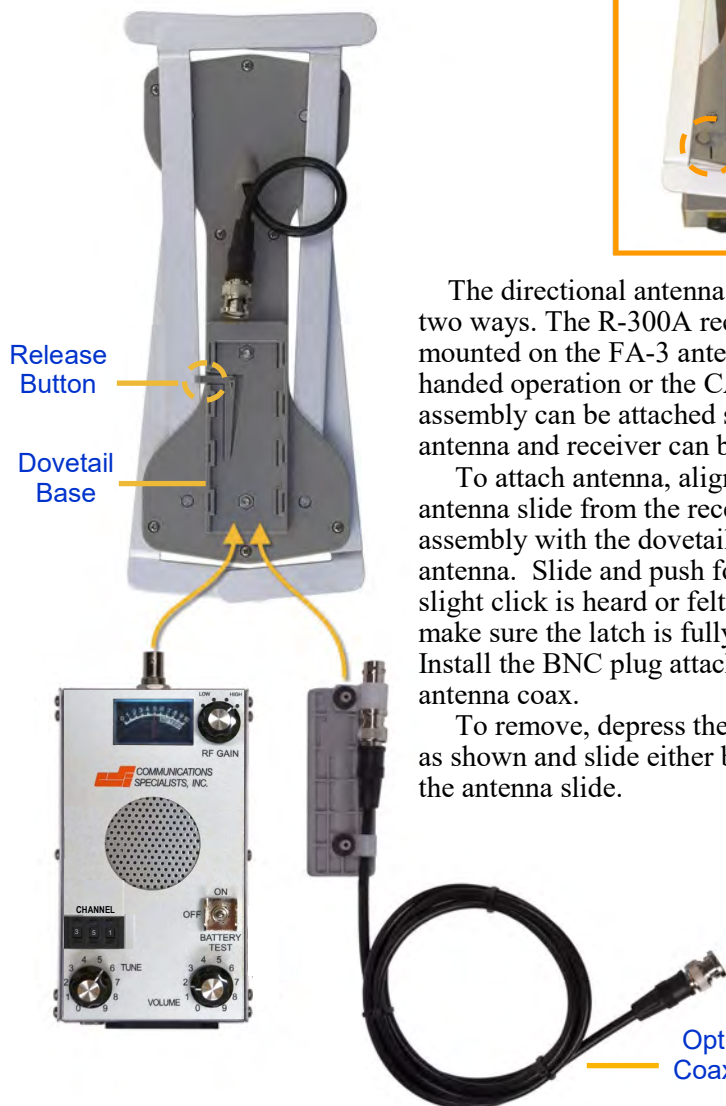

The R-300A is supplied with a high gain, directional antenna that attaches directly to the receiver. In order to find your transmitter's direction, the antenna elements must be fully extended as shown on page 10. You may change the polarity by rotating the receiver with your hand. The photos on page 10 show both vertical and horizontal polarization. Hold the R-300A as shown in the photos and try both vertical and horizontal polarization while turning your body around in a circle. See which polarity either gives the loudest signal or the most accurate bearing information.

The directional antenna comes with a removable pistol grip handle. You can use the receiver with or without the grip. The grip slides into the bracket beneath the antenna and will lock into place with a small click. To remove the grip, depress the grip release button slightly and slide grip free as shown in Figure A.

A holster style carrying case is supplied with the receiver. It can be attached to a belt and worn while searching for your transmitter, or used to protect the receiver and antenna during storage. There is a small pocket on the case for storing spare 9 volt batteries.

To collapse the antenna elements, slide the numbered buttons shown in Figure B. Start with position 1 as you gently fold in the elements. Repeat for positions 2 through 4. When opening the antenna it does not matter which order the elements are unfolded.

The directional antenna can be used in two ways. The R-300A receiver can be mounted on the FA-3 antenna for one handed operation or the CA-4 coax assembly can be attached so that the antenna and receiver can be separated.

To attach antenna, align the dovetail antenna slide from the receiver or cable assembly with the dovetail base on the antenna. Slide and push forward until a slight click is heard or felt. Pull back to make sure the latch is fully engaged. Install the BNC plug attached to the antenna coax.

To remove, depress the release button as shown and slide either backwards off the antenna slide.

## ORDERING

Order using VISA, MasterCard, Discover, American Express, PayPal, check, or money order by toll-free phone, FAX, mail, web or E-mail.

## FAST SAME DAY SHIPPING

### R-300A RECEIVER

Includes:

- Folding directional antenna
- Holster style carrying case
- 9 volt battery.

## STANDARD ACCESSORIES:

**FA-3** Spare high gain, directional antenna

**FA-3-C** Spare receiver/antenna case

## OPTIONAL ACCESSORIES:

**QA-8** Mono headphone adaptor, 1/4" female to 3.5 mm male

**CA-4** Coax Assembly 5' long with molded BNC connectors, barrel connector, and clamps assembled on antenna slide so antenna can be used when detached from R-300A

**CM-1** 12vdc Cigarette lighter power cable

**RA-9** Omni directional magnet mount antenna for automobile roof-top w/coax

\* FA-3 and FA-3-C are shipped at no extra cost with each R-300A

## TROUBLESHOOTING

**The R-300A sounds different than it used to:**

- Test battery and replace if the needle is below 8 on the meter.  
(see page 5)

**There is no audio coming from the speaker:**

- Make sure the MHz frequency switch is set to 2, 3 or 4. (see page 7)

**Unable to hear signal from transmitter:**

- Set the RF GAIN SWITCH to the high position, fully clockwise.  
(see page 5)

## FCC COMPLIANCE INFORMATION

The R-300A complies with Part 15 of the FCC rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference including interference that may cause undesired operation. Changes or modifications not expressly approved by Communications Specialists, Inc. could void the user's authority to operate the equipment.

## ABOUT US

Communications Specialists, Inc. has been building quality electronic products that the amateur radio, land mobile, wildlife telemetry, aviation, R/C, and pet industries have come to rely on for over 40 years. At our Orange California factory, we utilize the latest in surface mount assembly technology to assure consistent quality throughout our entire product line. All our products are made in the USA.

## WARRANTY

The R-300A is warranted to be free of defects in materials and workmanship for a period of one (1) year from the date of purchase. If you need to take advantage of our warranty, please follow these steps:

1. Securely package the R-300A.
2. Include a note as to the nature of the problem.
3. Include your shipping address and a daytime phone number or E-Mail address.
4. Ship to:

**COMMUNICATIONS SPECIALISTS, INC.**

426 WEST TAFT AVENUE • ORANGE, CA 92865-4296

714.998.3021 • FAX 714.974.3420
